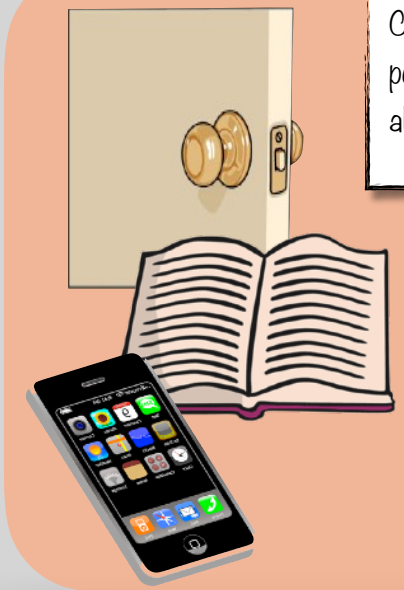
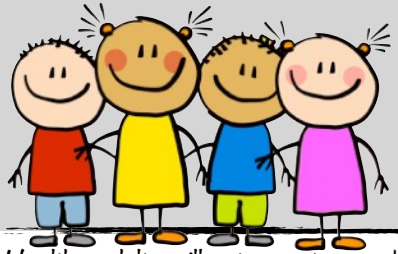
Coronavirus

What to do?



Coughing and sneezing onto a surface or another person is the best way to spread a virus. It can stay alive outside a body for up to **three days**.



Healthy adults will get symptoms a bit like a cold. Children might not even notice that they are ill because the symptoms are so mild. Once you have had it you won't get it again but you could carry it and spread it.

Schools have closed in lots of countries but in England that are currently still open.

- Can you think about reasons why the school might need to close?
- Are there reasons why it should definitely stay open?

There is currently no vaccine to stop people getting the virus.

People **over 70** and anyone with a **serious medical** condition such as diabetes or heart disease are at a higher risk of being **really poorly** or even **dying** if they are infected.

In many countries the governments have stopped things where people come into contact with each other. The British government is just starting to do this.
